

SUPPORT™ D

Prevention *before* Treatment

LET'S GROW
TOGETHER

The new formula for salmon farming

Winter sores are among the top 3 causes of losses and reduced welfare in salmon farming. Fish skin is an important barrier to protect the fish from external invasion of parasites and microbes. Aller Aqua's functional fish feed SUPPORT D improves skin health by supporting mucus layers, resulting in:

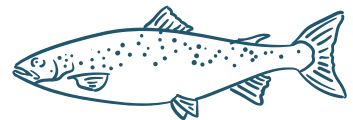

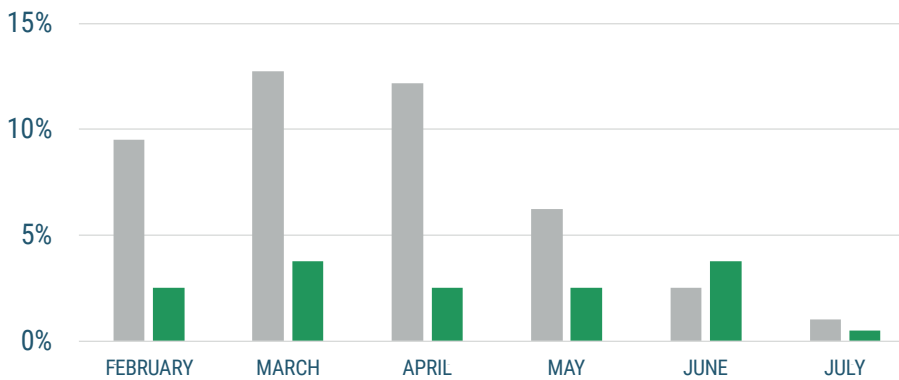

Prevention *before* Treatment

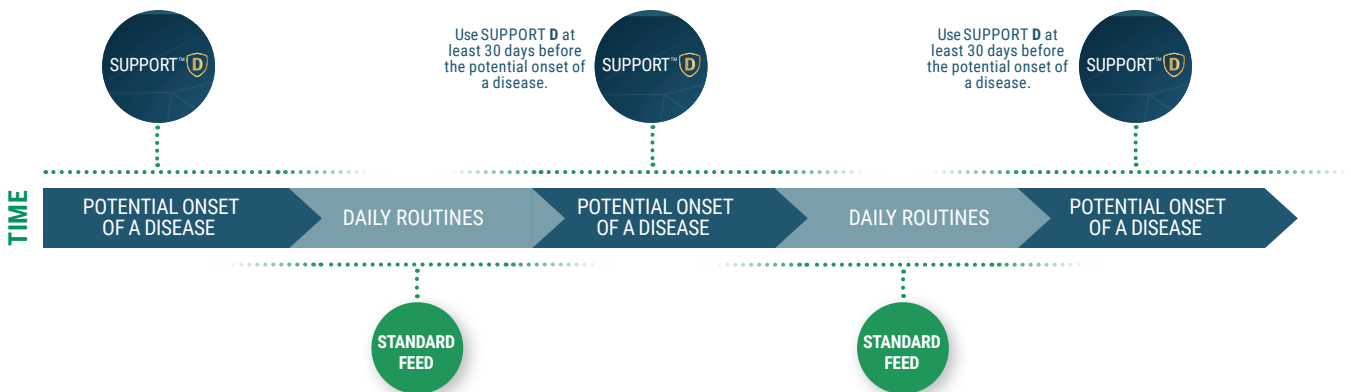

SUPPORT D helps the salmon protect itself

- Lower prevalence of winter sores and jaw infection**
Reduction from 12% to 2%, with visible results after two months of feeding
- Reduced mortality**
35% reduction in total mortality
- Increased welfare of fish**
50% fewer deaths with wound/jaw infection

The compound formula supports overall skin health by boosting the fish's own mucus layers, thus preventing parasites and microbes from festering and causing problems.

Commercial scale trials of SUPPORT D have shown significant reduction in wounds in alive fish.
