

LET'S GROW
TOGETHER

SUSTAINABILITY

At Aller Aqua sustainability is a core part of what we do and something we have worked with for a long time. Sustainability is part of our strategy, and we work continuously to improve the different areas of our business.

At Aller Aqua we are proud to be among the first aquafeed companies worldwide to be verified to label our products with CO₂ equivalents. The labelling is based on the PEFCR guidelines created by the European Commission. The PEFCR guidelines are a ruleset describing how to calculate the environmental footprint of a specific product group.

Displaying our CO₂ equivalents is a way for us to be transparent, whilst the verification validates our methods and results. This will enable our customers to calculate and display the carbon footprint of their products.

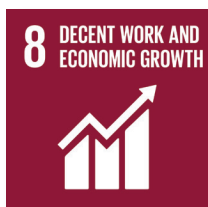

We support UN's Sustainable Development Goals, and we are proud to be part of a sustainable future. Although we work with a majority of the goals in the daily running of our business, we have chosen four goals in order to focus our effort:

Everyone has the right to nutritious meals.

We support goal 2 by delivering high-quality high-efficiency fish feed and thereby enabling fish farmers to produce healthy food, rich in proteins, for their families, whilst making a living.

Selling the fish locally makes healthy food more accessible locally, whilst creating funds for more food, as well as developing the business.

Decent work can have a big impact on a family's earnings.

Many governments see that an increase in aquaculture is necessary to sustain growing populations with food, and lower import. We support schemes to broaden the knowledge and spread of aquaculture worldwide.

We advocate for an increase in aquaculture, which will create both decent work and economic growth for the involved families, as well as at government level.

We are all responsible for taking care of the environment.

We produce environmentally friendly high-quality fish feed, which reduces the impact on the water environment as well as the climate in general. Our feed pellets reduce water pollution by minimizing waste in the water and ensuring that the farmer achieves maximum output from minimum input. We support a wider spread of aquaculture, which creates the smallest carbon footprint of any meat production.

By choosing regionally sourced raw materials, we ensure a reduction in transport-related pollution.

Protecting our oceans is vital.

Using Aller Aqua's environmentally friendly fish feed reduces discharge in the water.

We consider our use of raw materials carefully to reduce use of marine ingredients, thus protecting wild fish in their natural habitats.
