

Freshwater animal species – views and values

Cut out the statements and place them on the graphic organiser according to your values and views. There are no right or wrong answers.

All creatures have mana and are of value	It's up to experts like the Department of Conservation to look after species	Introduced species, like sport fish, add value to lakes and rivers	We value and protect species like kiwi and kea because they are cuter than fish
Koi carp and gold clams are so widespread it's not worth the effort to control them	Fishing connects people to place and shared practices, passing on knowledge	Native freshwater species have more value than introduced species	Fish, kōura and other kai species are for us to catch whenever we wish
Trout and Chinook salmon are introduced species that disrupt natural ecosystems	Iwi and local groups need to be included in freshwater resource decisions	Morihana (introduced wild goldfish) is a designated taonga species and should be protected	We should focus on 'fixing' ecosystems rather than individual species
