

Suicide Data: United States

Suicide is a public health problem and leading cause of death in the United States. Suicide can also be prevented – more investment in suicide prevention, education, and research will prevent the untimely deaths of thousands of Americans each year. Unless otherwise noted, this fact sheet reports 2023 data from the CDC, the most current verified data available at time of publication (April 1, 2025).

49,316 Americans

died by suicide making it the **11th leading cause of death**.

- **2nd** leading cause of death for ages 10-34
- **4th** leading cause of death for ages 35-44
- **5th** leading cause of death for ages 45-54
- **Over one third** of people who died by suicide were 55 or older

12.8 million adult Americans have thought about suicide.

1.5 million Americans attempted suicide.

Men died by suicide **3.8 times** more often than females.

Suicide attempts in the past year were highest among American Indian/Alaskan Native adults and adults who identify with two or more races

58% of firearm deaths were suicides.

55% of all suicides were by firearms.

In 2021, the suicide rate was **2 times higher for Veterans** than for non-Veteran adults over the age of 18.

90% of those who died by suicide had a diagnosable mental health condition at the time of their death.

46% of Americans ages 18+ living with a mental health condition received treatment in the past year.

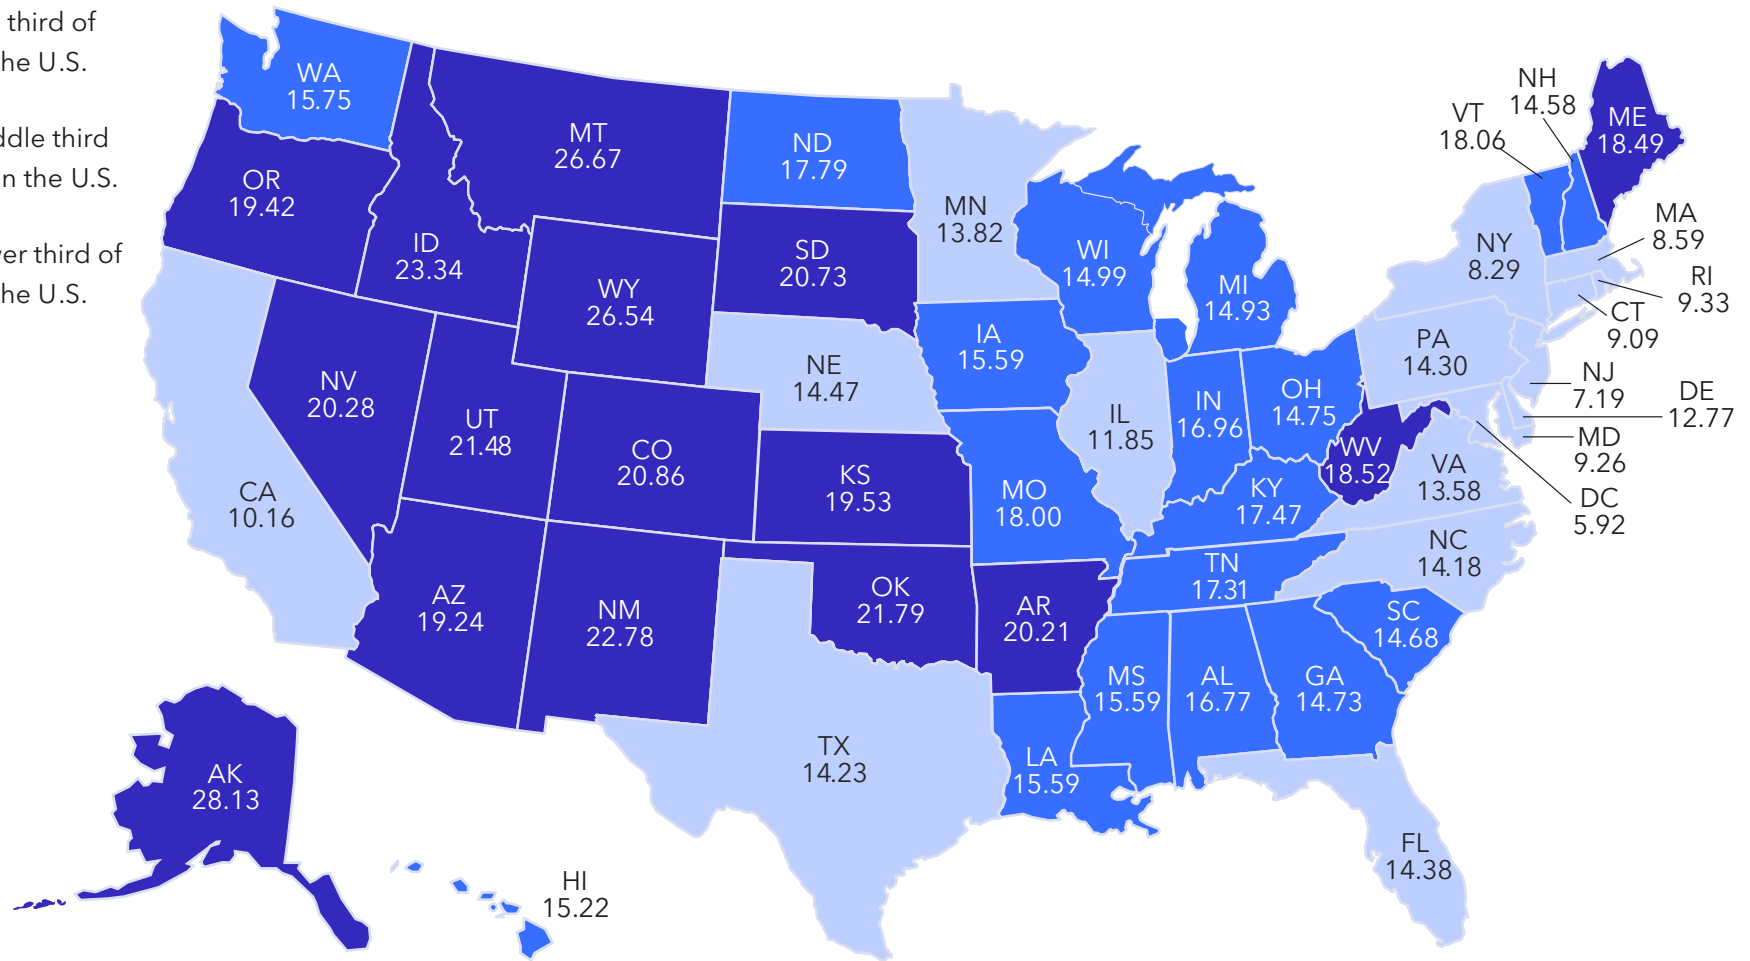

73% of communities in the United States did not have enough mental health providers to serve residents in 2022, according to federal guidelines.
