Malleable Intelligence

Climate is a new philosophy in workplace environments, conceived for people in a fast-moving, ever-changing business world where the future is beyond prediction.

A malleable work platform that is continuously evolving, it places you at the centre of its psyche and empowers individuals and teams to work truly collaboratively.

Contents

The manual is divided into 6 chapters. These chapters provide detailed information covering all the standard products within Climate:

- core assembly
- connect
- storage
- tables
- markers
- soft architecture

Core Assembly

The core infrastructure for Climate is made up of the Channel (a beam-like structure) and support legs. The following chapter discusses:

channel options

channel leg options

channel assembly options

Channel

The core function of the Channel is to support elements and the related cabling required within the office environment. The extruded Channel has a fully loaded, unsupported maximum span of 3200 mm.

The Channel is sectioned internally to divide the power cables from the data cables. Each Channel features slotted holes which enable data cables to travel from the upper Channel cavity through the Channel and into the Voice and Data Slide.

Climate related elements can be secured into a transom detail located on either side of the Channel. The Channel transom detail differs from both the Vertical and Horizontal Accessory Slide.

Features

In profile the Channel is a "H" shape and can be divided into three areas:

Top cavity = Data services + Marker support

Underside cavity = Power services + cable management elements

Transom faces = Accessory elements

Channel Assembly: Standard Dimensions

There are seven standard Climate Channel assembly lengths. The appropriate Channel length can be specified depending on the type of assembly being created and the amount of flexibility required from the assembly.

Longer Channels are an economical option because they provide greater Channel real estate whilst requiring less structural leg support. However, shorter Channels offer greater flexibility as they can be moved with ease and manipulated into more practical configurations within confined spaces.

The Climate Channel is set at a standard height of 820 mm from the floor however, 50 mm of fine adjustment is integrated into the T-leg to ensure a level Channel height is maintained.

ISOMETRIC VIEW

ELEVATION

At-Wall Assembly

The 'At-Wall' Assembly can be used where an organisation's planning approach requires them to locate people along either a perimeter of a building or against an internal wall. The assembly comprises the normal Climate Channel supported by an 'At-Wall' leg. The legs assist in bearing the load that might be placed on the channel.

All Channel lengths can be used in combination with the At-Wall bracket. Cable reticulation can be either through the legs or directly into the channel from its underside, with the data and power cables remaining segregated at all times.

Features

The 'At-Wall' Assembly incorporates a special bracket to attach the Channel to the wall.

The 'At-Wall' bracket works with any length of the Channel, up to 3.2 metres.

There are two alternative methods to bring power and data into the At-Wall Assembly.

Please see the cable reticulation pages under 'connect' to review these options.

ISOMETRIC VIEW

ELEVATION

At-Wall Leg

The 'At-Wall' Leg provides strength and support to the At-Wall Channel, safely holding the associated loads of multiple Climate elements when the channel is attached to the wall.

Features

The At-Wall leg features 50mm of levelling and adjustment .

Provides a way for data and power to be reticulated separately to meet AS/NZS4703:2007 safety standards.

ISOMETRIC VIEW

ELEVATION

T-Leg

The T-Leg provides stability for the Channel and is engineered to safely support the cantilever load requirements associated with the addition of Climate elements.

Features

The T-Leg features 50 mm of levelling adjustment.

The "T" Shape minimises the interference between the Table Leg and the T-Foot.

A **Cable Swivel** and a **Cable Articulator** are always used in conjunction with a T-Leg.

ISOMETRIC VIEW

ELEVATION

specifications_

material	aluminium and steel
finish	powder coat
colour	black, white and silver

Shared T-Leg

The shared T-leg allows continuous channel solution where two beams connect without gap and leg supports both channel ends.

Features

The Shared T-Leg features 50 mm of levelling adjustment.

The "T" Shape minimises the interference between the Table Leg and the T-Foot.

A **Cable Swivel** and a **Cable Articulator** are always used in conjunction with a T-Leg.

ISOMETRIC VIEW

ELEVATION

specifications_

material	aluminium and steel
finish	powder coat

Channel Assembly: Shared T-Leg

The Shared T-Leg provides stability and connects two channels for continuous cable reticulation and linear configuration.

Features

The T-Leg features 50 mm of levelling adjustment.

A **Cable Swivel** and a **Cable Articulator** are always used in conjunction with a T-Leg.

ISOMETRIC VIEW

ELEVATION

specifications_

material	aluminium and steel
finish	powder coat
colour	black, white and silver

T-Foot (Optional – Rollerball)

The T-Foot has a low profile to not only minimise possible trip hazards but to also minimise any interference with the table leg. The T-leg also has an integrated foot glide to maximise ease of movement and is available with rollerball option.

Features

The T-Foot features 45 mm of levelling adjustment. The "T" Shape minimises the interference between the Table Leg and the T-Foot.

A **Cable Swivel** and a **Cable Articulator** are always used in conjunction with a T-Leg.

ISOMETRIC VIEW

Swivel Junction Leg

The Swivel Junction Leg is identical to the Swivel Junction T-Leg with the exception of the "T" shaped foot being replaced with a disc foot. The Swivel Junction Leg is used to support three or four Channel configurations because these do not require the extra foot support. The disc foot does not interfere with the table understructure resulting in greater space flexibility.

Features

The Swivel Junction Leg features a dynamic central spine which allows the Channels to swivel while maintaining structural integrity.

Cabling can travel through the vertical shaft of the leg from the floor to service the Channel. Or alternately, a Cable Swivel can be secured to the top of the shaft which supports cabling from the ceiling.

This is detailed further in the **Connect** chapter under **Cable Reticulation**.

ELEVATION

specifications_

material	aluminium, steel and plastic
finish	powder coat
colour	black, white and silver

Swivel Junction T-Leg

The Swivel Junction T-Leg provides stability for the Channel however, unlike the Swivel Junction Leg it has the ability to support and service two Channels.

Features

The Swivel Junction T-Leg features a dynamic central spine which allows the Channels to swivel while maintaining structural integrity.

Cabling can travel through the vertical shaft of the leg from the floor to service the Channel or alternately, a Cable Swivel can be secured to the top of the shaft which supports cabling from the ceiling.

This is detailed further in the **Connect** chapter under **Cable Reticulation**.

Connect

All services are reticulated throughout the Channel and are made available to the user via a number of cable management elements and core assemblies. Climate has a highly resolved cable reticulation infrastructure. It is made up of:

cable reticulation

cable management elements

technology related elements

Channel

The Channel houses power and data (which is illustrated in the following drawings on this page).

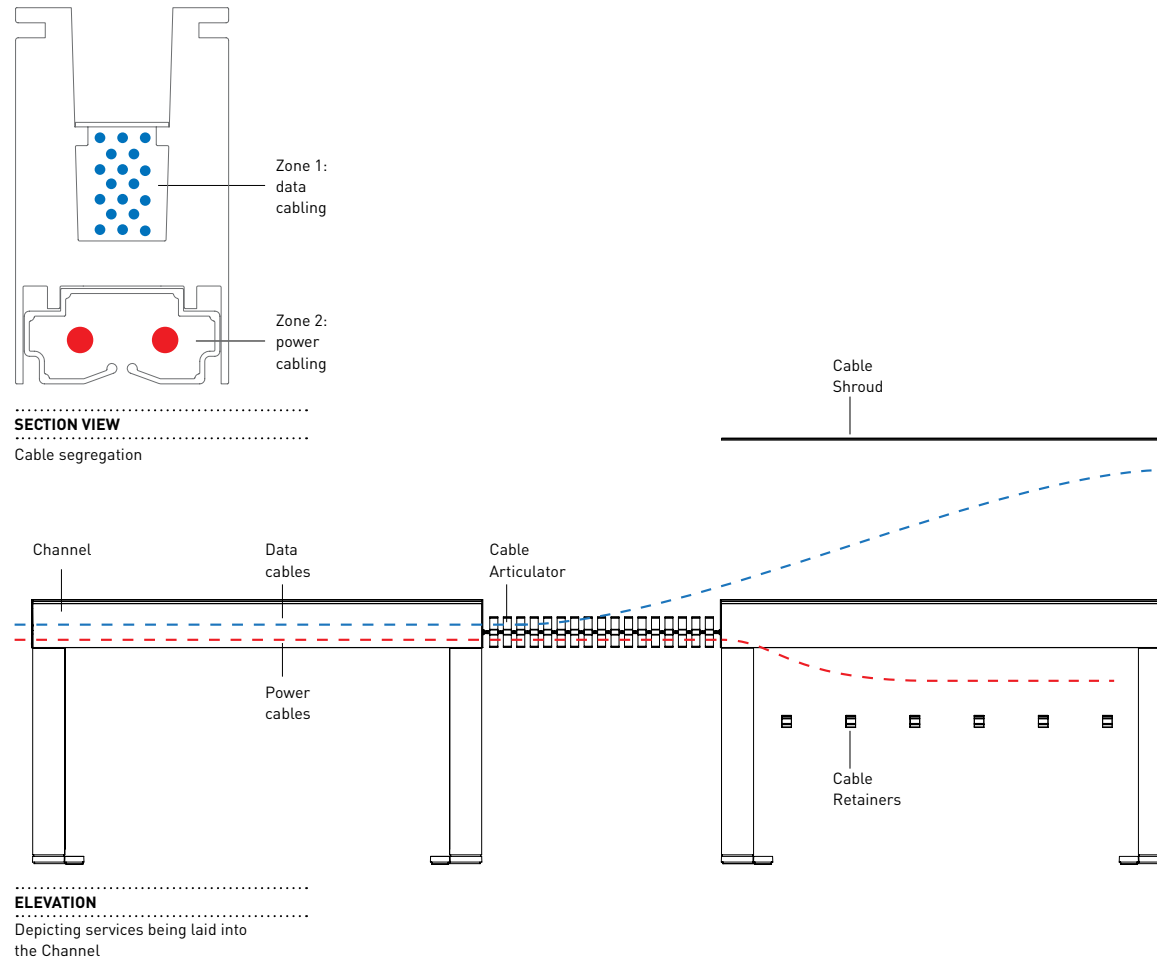

Channel Cable Reticulation

Laying services into the Climate Channel is quick and easy because the cable cavities in the Channel can be easily accessed.

Data cabling can be added to a Climate assembly by removing the Cable Shroud (no tools required) which is located at the top of the Channel. Once the shroud is removed cabling can be laid into the data cavity.

Individual cables can be delivered to Data Slides located to the face of the Channel by threading the cable through purpose cut slots located at intervals along the Channel. Once the cabling has been laid the Cable Shroud can be re-located.

Power cabling is secured under the Channel and is supported by Cable Retainers. The retainers are located at 200mm intervals along the underside of the Channel.

At-Wall Cable Reticulation

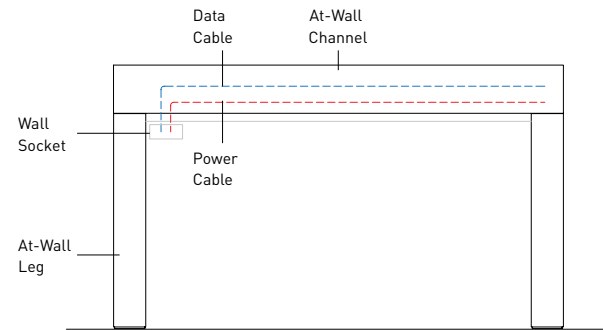

The At-Wall Channel Assembly provides two different ways, dependant on the wall type, to feed the power and data cables into the Climate Channel.

Underside Cable reticulation

The data and power cables emerge from a wall socket located at a point under the Channel and are reticulated directly into the Channel.

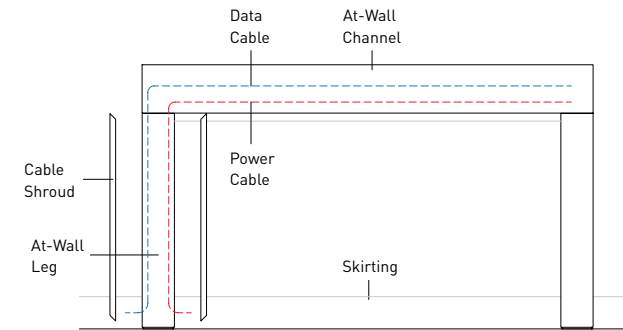

Direct Leg Cable Reticulation

The data and power cables emerge from the skirting board near the floor and are reticulated directly into the leg cavities.

EXPLANATORY DIAGRAM

Underside cable reticulation

EXPLANATORY DIAGRAM

Direct leg cable reticulation

Cable Articulator

The horizontal Cable Articulator joins two Channel assemblies and provides a supporting conduit for both the data and power cables to travel through.

Features

The flexible "articulation" provides the additional benefit of creating dynamic Climate configurations. These configurations can be rapidly manipulated because the Cable Articulator can bend without structural compromise.

The knuckle assembly is secured with pins which enable the dynamic Channel configurations.

The Cable Articulator is made up of multiple modular components and is fixed to the Channel using a snap lock fastening which locks into the "Channel inner end cap."

Cable Swivel - Floor To Channel

The Cable Swivel is a cable reticulation product and is secured to both the floor and one end of a Climate strand.

Features

A bracket is mechanically fixed to the floor which acts as a structural pivot point allowing the Channel strand to move without damaging the cables. Since the cable retainers can swivel around a structural spine the cables are not stressed when the Channel strand is re-positioned. The Cable Swivel has been designed so that services can be accessed easily and reticulated quickly.

The floor version is slightly different compared to the ceiling version:

When the Cable Swivel is servicing cables from the floor, the umbilical and structural assembly is extended from the floor to the top of the Channel.

ISOMETRIC VIEW

ELEVATION

EXPLANATORY DIAGRAM

Cable reticulation

specifications_

material	plastic and metal
finish	powder coat and plastic

Cable Swivel - Ceiling To Channel

The Cable Swivel is a cable reticulation product and is secured to both the floor and one end of a Climate strand.

Features

A bracket is mechanically fixed to the floor which acts as a structural pivot point allowing the Channel strand to move without damaging the cables. Since the cable retainers can swivel around a structural spine the cables are not stressed when the Channel strand is re-positioned. The Cable Swivel has been designed so that services can be accessed easily and reticulated quickly.

The ceiling version is slightly different compared to the floor version:

When the Cable Swivel is servicing cables from the ceiling the umbilical and structural assembly is extended the entire distance from the floor to the entry point in the ceiling. This ensures structural integrity and aesthetic consistency.

ELEVATION

EXPLANATORY DIAGRAM

Cable reticulation

specifications_

material	plastic and metal
finish	powder coat and plastic
colour	black, white and silver

Swivel Junction - Floor to Channel

The Swivel Junction doubles as a dynamic structural support and cable reticulation product. This product can be used to service the Climate Channel from the floor or from the ceiling.

For the floor version, a cap is secured to the top of the Swivel Junction spine for aesthetic purposes.

Cable retainers are located the length of the internal shaft and can swivel which ensures that the cables are not stressed when the Channels are rotated.

A locking mechanism secures the first Channel to the Swivel Junction shaft so it can not rotate. This stops additional Channels from rotating beyond the allocated cable bend radius

ISOMETRIC VIEW

finish	powder coat and plastic
colour	black, white and silver

Swivel Junction - Ceiling to Channel

The Swivel Junction doubles as a dynamic structural support and cable reticulation product. This product can be used to service the Climate Channel from the floor or from the ceiling.

For the ceiling version a vertical umbilical is secured to the top of the Swivel Junction spine up to a fixing bracket in the ceiling.

A locking mechanism secures the first Channel to the Swivel Junction shaft so it cannot rotate. This stops additional Channels from rotating beyond the allocated cable bend radius.

Cable retainers are not required within the leg because all the cabling is reticulated through the vertical umbilical and Channel.

Power Slide Dual & Quad (Australian Outlets)

The Power Slide Unit is available in two different sizes (dual and quad).

Features

The Power Slide unit is transom mounted to the vertical face of the Channel. Each unit can slide along the face of the Channel. The sliding distance depends on how long the cable is between the plug and the Power Slide.

Each Power Slide may be locked along the face of the Channel with the use of an additional accessory.

*We advise you consult with your IT department to lock your Power Slide.

Power Bar

The Power Bar is an alternative method of bringing power and communications outlets to the worktop. Supplied with the Cable Catcher, the Power Bar is mounted to the underside of the channel, and has been designed to allow for the full adjustment of sit/stand worktops without any interference to any device plugs attaching to the unit.

Features

The Power Bar utilises the Lettrix range of power modules and is available in dual and quad options. An angled data tile allows economic use of space, with a maximum of an extra 8 power and 4 communication outlets per channel. It is intended for dual and double-sided use and is technician adjusted.

*Any electrical parts to be ordered separately from SchiTech (works only with Lettrix products).

ISOMETRIC VIEW

Power Fin

The Power Fin has been designed to give the user an option to have outlets accessible below the channel. Mounted to the underside and located at any point under the channel, it allows the user to have the options of increasing the number of outlets per workstation or minimising accessories above the worktop.

Features

The Power Fin is an alternative method of bringing power and communications outlets to the worktop, utilising the Lettrix range of power modules with a maximum of an extra 8 power and 4 communication outlets per channel. The Power Fin is intended for dual and double-sided use.

*Any electrical parts to be ordered separately from SchiTech (works only with Lettrix products).

Voice & Data Slide

The Voice & Data Slide unit is available with four outlets which can be activated during installation. Each unit can be located on the outer vertical face of the Channel and can slide one metre along the face.

Features

The Voice & Data Slide is transom mounted to the vertical face of the Channel. Each unit can slide along the face of the Channel. The sliding distance depends on the length of cable.

The Voice & Data Slide is available in one size, however it can accommodate up to 4 outlets.

Each Voice & Data Slide may be locked along the face of the Channel with the use of an additional accessory.

*We advise you consult with your IT department to lock your Voice and Data Slide.

Cable Catcher

The Cable Catcher can be located at any point under the Channel and is used to manage excess cabling from Channel dependant elements and personal accessories.

Features

The Cable Catcher features independent fold down catchers that can service height adjustable work surfaces (Aust. Standard minimum height 610mm).

The fold down Cable Catcher can be activated to catch loose cables from the work surface.

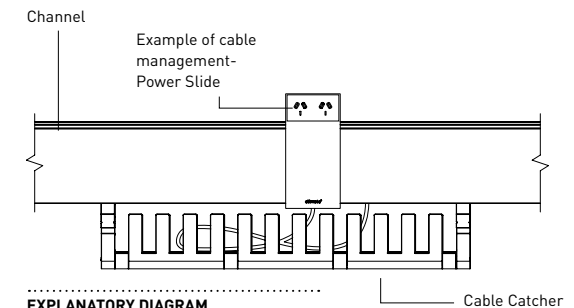

When not in use the Cable Catcher can be retracted to a flush position, matching the overall width of the Channel.

Cable Wrap

The Cable Wrap can be located at any point under the Channel and is used primarily for managing extra cabling from accessory products such as floor mounted computers and associated USB devices.

Features

The Cable Wrap provides a means of organising cables travelling between the floor and the Channel.

The Cable Wrap caters for cables ranging between 3 & 12 mm in diameter.

Understructure Cable Reticulation

Every Climate Table features a structural beam on the underside of the worksurface. This beam can also act as a cable reticulation product with the addition of Cable retainers. These retainers can be located where required to ensure cabling is secured neatly off the floor.

Markers

Climate Markers are easily interchangeable and do not require technical assistance. Marker elements include a range of markers in various configurations and finishes. This chapter includes:

marker types

marker fixing

marker sizes

marker options

Marker Types

The standard Climate range features two different Marker Styles. The Solid State Marker and Sculptured Marker options both require a small Marker Fixing to secure them into the Channel.

SOLID STATE MARKER

Marker created from a single material with consistent profile.
Profile thickness of 12 mm.
Fixing length to match marker length.

SCULPTED MARKER

Profile is irregular however a detail at the bottom of the marker aligns with the marker fixing.
Max. marker thickness is 18 mm with fixing thickness of 12 mm.
Fixing length to match marker length.

Marker Fixing

The Marker Fixing is made from Expanded Polypropylene (EPP). The fixing secures a range of panels thicknesses into the core Channel cavity. The fixings are light weight and can be re-used or replaced.

material	expanded polypropylene
finish	raw
colour	black

Marker Sizes

Climate Markers are available in the following dimensions.
Not all Marker options are available in every size.

specifications_

material	varies
finish	varies
colour	varies

Acrylic Photo Frame

This dual sided photo frame allows you to display photos, postcards and single sheets of paper to personalise the Climate workspace while offering privacy. Available in three sizes the photo frame can be positioned in landscape or portrait orientation.

Features

The magnetised frame is easily opened allowing for items to be quickly inserted or removed.

Synthetic Felt Marker

A solid state marker, the PET Marker is created from a synthetic felt which inserts into the channel to provide privacy between worktops. Used in conjunction with the Marker Fixing, the PET Marker is available in 12 mm and in a variety of colours.

Fractal Screen

The Fractal Screen is a lightweight divider that allows the user to adjust their privacy depending on how the screens are layered within the Climate Channel.

The Fractal Screens have been designed to slide together or apart to create a dense or subtle division over the Channel.

The Supple Bands have been designed to hold lighter items such as personal images and cards while the branches are able to hold heavier items such as keys and name identification cards.

specifications_

material	plastic
finish	moulded texture
colours	terra, lipstick, spring, shine, white and black

Soft Architecture

Offering unlimited possibilities, a collection of soft architecture elements complement the Climate range. This chapter includes:

soft boundary collection
modesty blanket

Soft Boundary Collection

The Soft Boundary Collection is a range of considered forms created from synthetic felt. Currently, the collection includes three pieces – Stratus, Cirrus and Nimbus.

These pieces can be used individually, or in various combinations, to create an appropriate personal space for work. Notably, the Soft Boundary Collection empowers employees to make immediate workspace adjustments.

STRATUS

Depth of 370 mm

CIRRUS

Depth of 300 mm

NIMBUS

Depth of 270 mm

Modesty Blanket

The Modesty Blanket provides visual privacy around the underside of the Climate table and secludes personal space from sight via a unique aesthetic. A simple hook system lodges into a grooved edge on the under carriage of the table, allowing the Modesty Blanket to easily connect and move pending the user needs.
