

CBG

Compressed Biogas

Product description

Compressed Biogas (CBG – Compressed Biogas) is a 100% renewable transport fuel produced from biogenic material, such as biological waste and industrial residual products. CBG consists primarily of methane and is mainly used for passenger car transport.

Benefits

- 100% renewable fuel which provides a significant reduction in fossil carbon dioxide emissions compared with conventional fuels.
- High energy content per kilogram compared with diesel and petrol.

Applications

CBG is primarily used for light passenger car transport and requires vehicles equipped with gas-adapted engines. The vehicle must be approved for gas operation, often marked for CNG/CBG.

Always check with the vehicle manufacturer that the fuel is approved for the specific vehicle type.

Health, environment and safety

See safety data sheet. Follow applicable safety regulations and use recommended protective equipment.
