Both Verhoeff volumes together represent the 'Scripture' of millipede morphology. Verhoeff's morphology is detailed and summarizes all knowledge up to the time of publication. The volumes lacks an index and subheaders are used too sparingly, making this important work somewhat cumbersome to deal with. However, the morphological information is well worth the effort. Verhoeff uses his own 'nomenclature' for many of the groups. All synonyms of older names can be found in Hoffman, 1980 (see above) and on this web site in the Taxonomy section.
