A new troglobitic milliped of the genus *Nepalella* from China (Diplopoda, Chordeumatida, Megalotylidae)

By William A. Shear

ABSTRACT

Chordeumatid millipeds, undoubtedly very diverse in China, have only recently been discovered there, in the form of troglobites. *Nepalella caeca*, n. sp., (Megalotylidae) represents a new generic and familial record for China and is also the first troglobitic megalotylid to be discovered. The cave from which this species was collected evidently also hosts at least two more distinct species of troglobitic chordeumatids, but only female specimens were available for study.
