Plastic surgeon notices 'striking change' in Meghan Markle latest photos

A plastic surgeon has shared his opinion on Meghan Markle's latest photos from new Harper's Bazaar cover after comparing these with her 2022 cover of The Cut.

Top Beverly Hills plastic surgeon Dr. Raffi Hovsepien reviewed the photos and suggested that Meghan may have undergone a blepharoplasty.

The surgeon has found that the "heaviness of her upper lids is no longer present."

The Harper's Bazaar cover shows "upper eyelid crease appears more defined, higher, and cleaner, while the skin between the crease and brow looks tighter and less hooded."

The expert told the Radar Online that's "very consistent" with the aesthetic outcome seen after upper blepharoplasty (eyelid surgery), Upper eyelid skin pinch technique, and conservative fat pad reduction."

Dr. Raffi said, "Meghan's recent photos show a noticeably more lifted, defined, and open upper eyelid area compared to her 2022 images. The tighter skin, higher crease, and reduction in lateral hooding all align with the type of transformation we typically see after an upper blepharoplasty or surgical brow/eyelid rejuvenation."

He added Meghan's eye shape now appears "brighter, more sculpted, and more refreshed", which is why the difference is so visible when compared to earlier years.

The doctor went on to explain, "There are also midface refinements, smoother under-eye transitions, and improved brow support that collectively enhance her overall look."

"These changes are aesthetic, cohesive, and professionally executed — but undeniably noticeable when placed side-by-side."
