Rear view: in Lyon, bus drivers see the city in a big way!

With this rear-view camera system, three areas have been addressed.

Safety, driving comfort and customer service.

In terms of safety, there are two screens, with the second screen providing a much wider view and allowing drivers to see customers in their blind spots.

The seats at the rear of the vehicle allow cyclists and scooters to overtake safely.

In terms of driving comfort, having the two screens close together and reducing head rotation also means that the rear-view mirrors no longer need to be adjusted, and in terms of training, it provides a similar view for both the driver and the trainer.

With this system, there are fewer problems with brightness in relation to the outside environment and also fewer problems with glare.

In terms of customer satisfaction, we have found that removing the external rear-view mirrors makes manoeuvring much easier, both when approaching stops and when parking.

Having a strip here allows people with reduced mobility to board safely, and the fact that this screen is closer means that if customers are standing on the front platform, they do not obstruct the driver's view.
