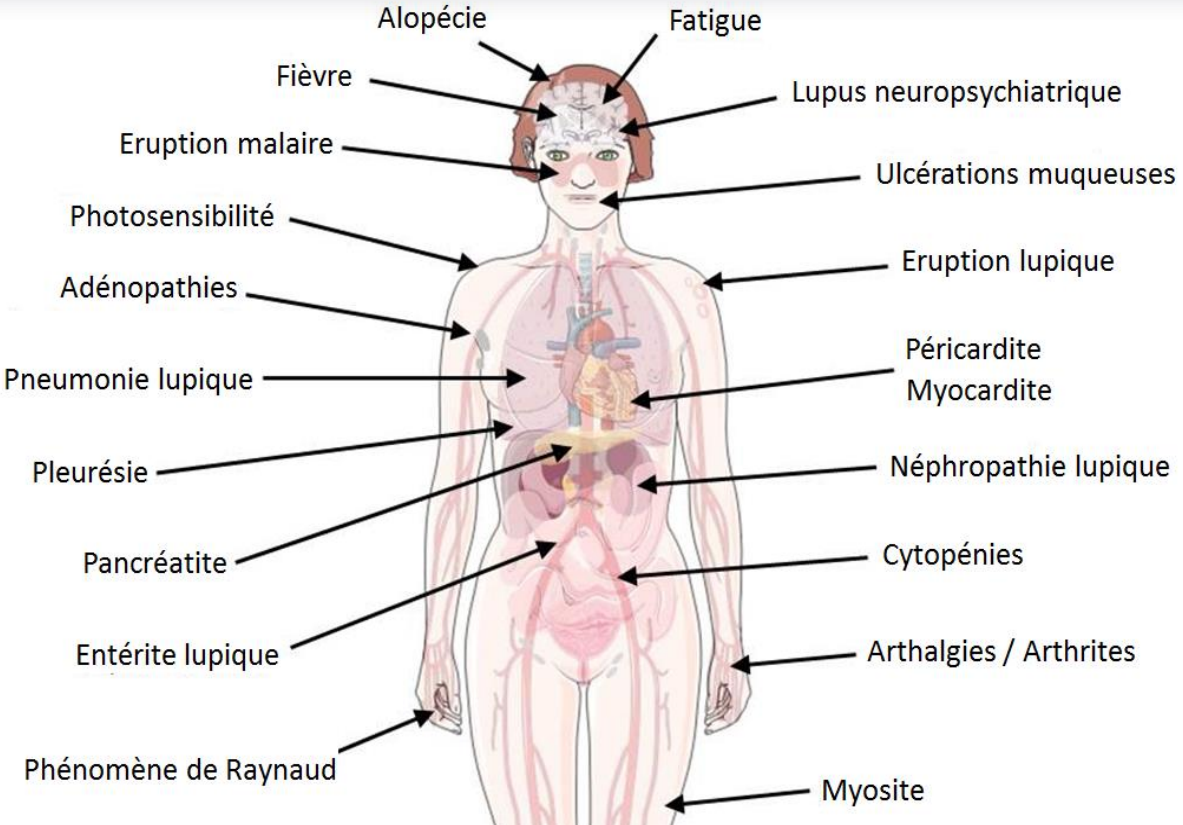
Le lupus systémique

Maladie autoimmune non spécifique d'organe

Caractérisée par:

- Manifestations cliniques polymorphes
- Présence d'anticorps anti-nucléaires (99%)
  - *anti-ADN natif (60-80%)*

Une maladie très polymorphe



Arnaud & van Vollenhoven. **Advanced Handbook of SLE**. Edition Springer

Une maladie très polymorphe

Genetic association analyses implicate aberrant regulation of innate and adaptive immunity genes in the pathogenesis of systemic lupus erythematosus

Figure 2 Summary of the functional roles of likely causal genes in SLE and other autoimmune diseases. The concentric rings in the figure show several layers of evidence to support functional annotation of the likely causal genes for SLE listed in **Table 2**. The genes are illustrated clockwise in chromosomal order, with gray arcs delineating loci at which several genes are implicated. Inner ring 1 shows each gene's functional category, taken from Ingenuity Pathway Analysis; inner ring 2 shows the presence of a *cis*-acting eQTL (**Fig. 1**) and/or coding variant; and innermost ring 3 shows the number of autoimmune diseases (excluding SLE) in ImmunoBase—type 1 diabetes, celiac disease, multiple sclerosis, Crohn's disease, primary biliary cirrhosis, psoriasis, rheumatoid arthritis, ulcerative colitis, ankylosing spondylitis, autoimmune thyroid disease, juvenile idiopathic arthritis, alopecia areata, inflammatory bowel disease, narcolepsy, primary sclerosing cholangitis, Sjögren's syndrome, systemic scleroderma and vitiligo—previously reported to be associated with the gene.

ETUDE AFRILUP

Bae et al. Arthritis Rheum 1998

Génétique ou environnement ?

Systemic lupus erythematosus in migrants from west Africa compared with Afro-Caribbean people in the UK

SLE has a high prevalence in Afro-Caribbean populations but has been reported to be rare in west Africa. We assessed prevalence (per 100 000) of SLE in women in an area of south London and estimated it to be 177 (95% CI 135–220) in Afro-Caribbeans, 110 (58–163) in west Africans, and 35 (26–43) in Europeans. The high prevalence of SLE in recent migrants from west Africa suggests that the disease is not rare in west Africa, and that there is a genetic basis for the high risk of SLE in people of west African descent compared with other groups.
