

Essai RENATO

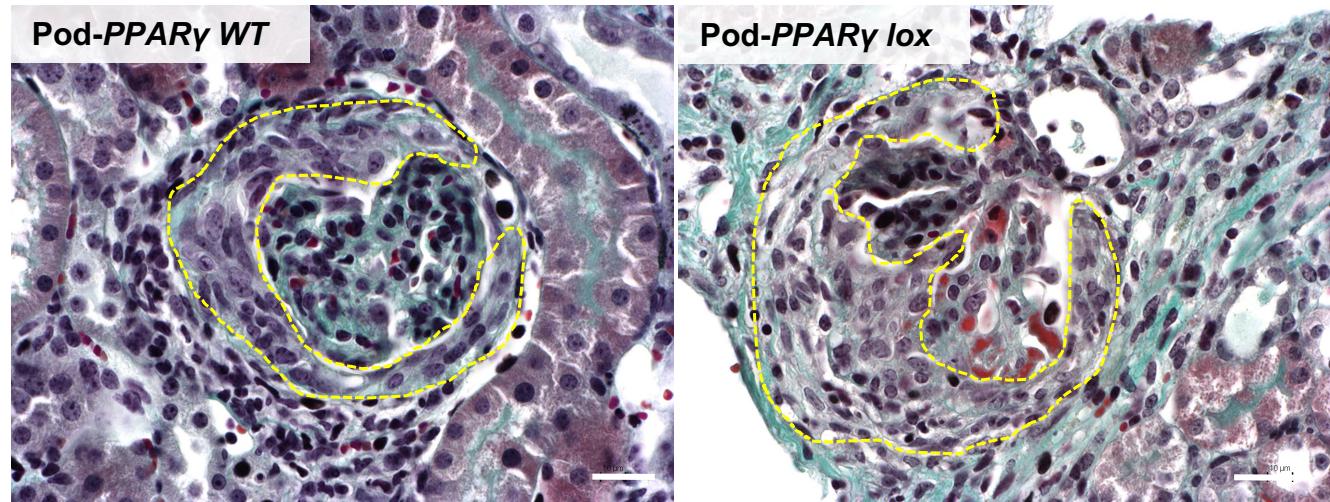

MULTICENTER **RANDOMIZED TRIAL TO EVALUATE THE
EFFICACY OF PIOGLITAZONE TO PROMOTE RENAL
TOLERANCE IN ANCA-ASSOCIATED VASCULITIS**

Introduction

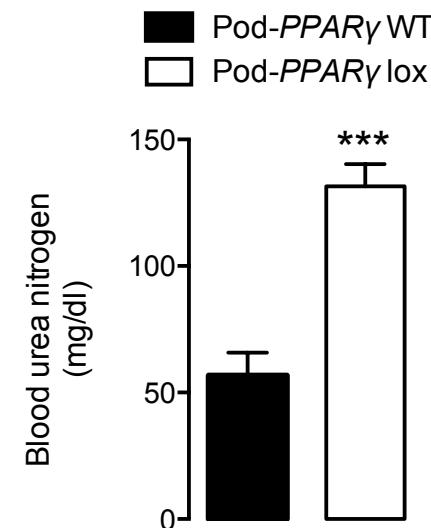

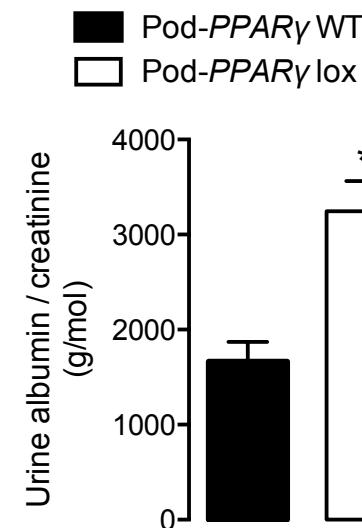

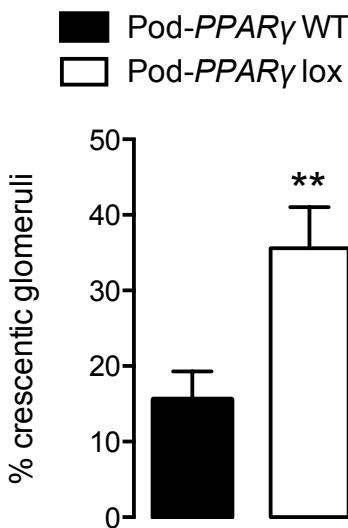

Comment limiter les séquelles rénales d'une poussée rénale de VAA ?

- Dépister et traiter précocément les poussées...
- Améliorer les schémas d'induction pour une efficacité plus rapide ?
- Epurer les ANCA circulants ?
- **Améliorer la « cicatrisation » rénale ?**

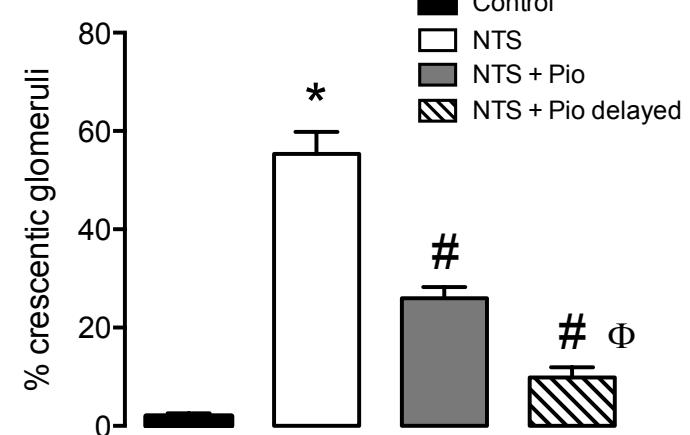

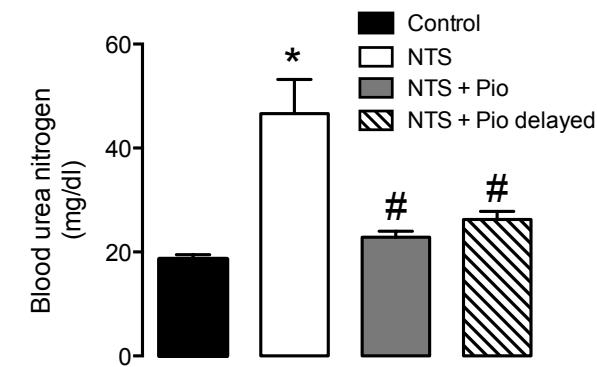

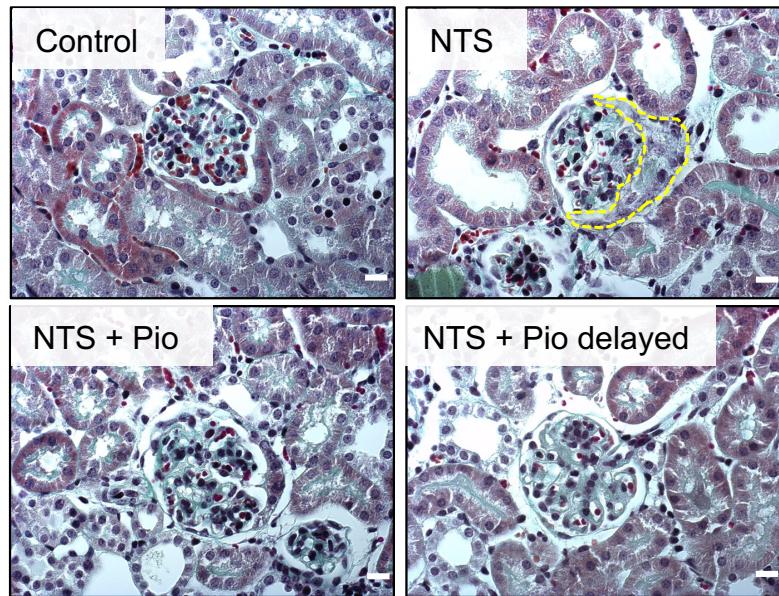

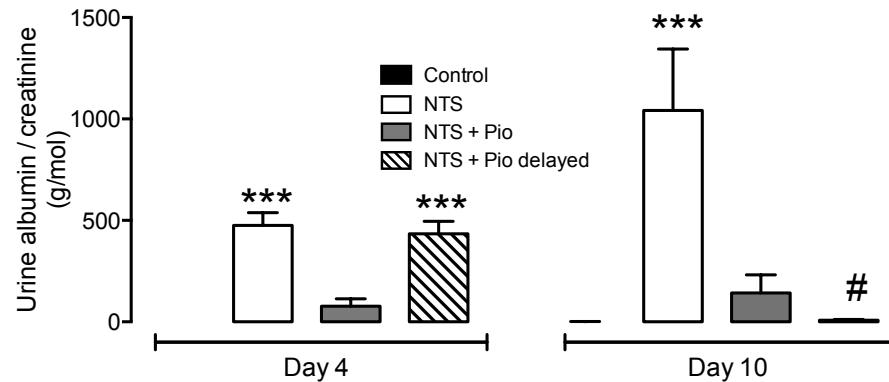

Podocyte Selective PPAR γ Deficiency Aggravates Crescentic RPGN

Henique et al.
J Am Soc Nephrol. 2016

Delayed PPAR γ Agonism Halts Crescentic RPGN

Henique et al. J Am Soc Nephrol. 2016;27(1):172-88

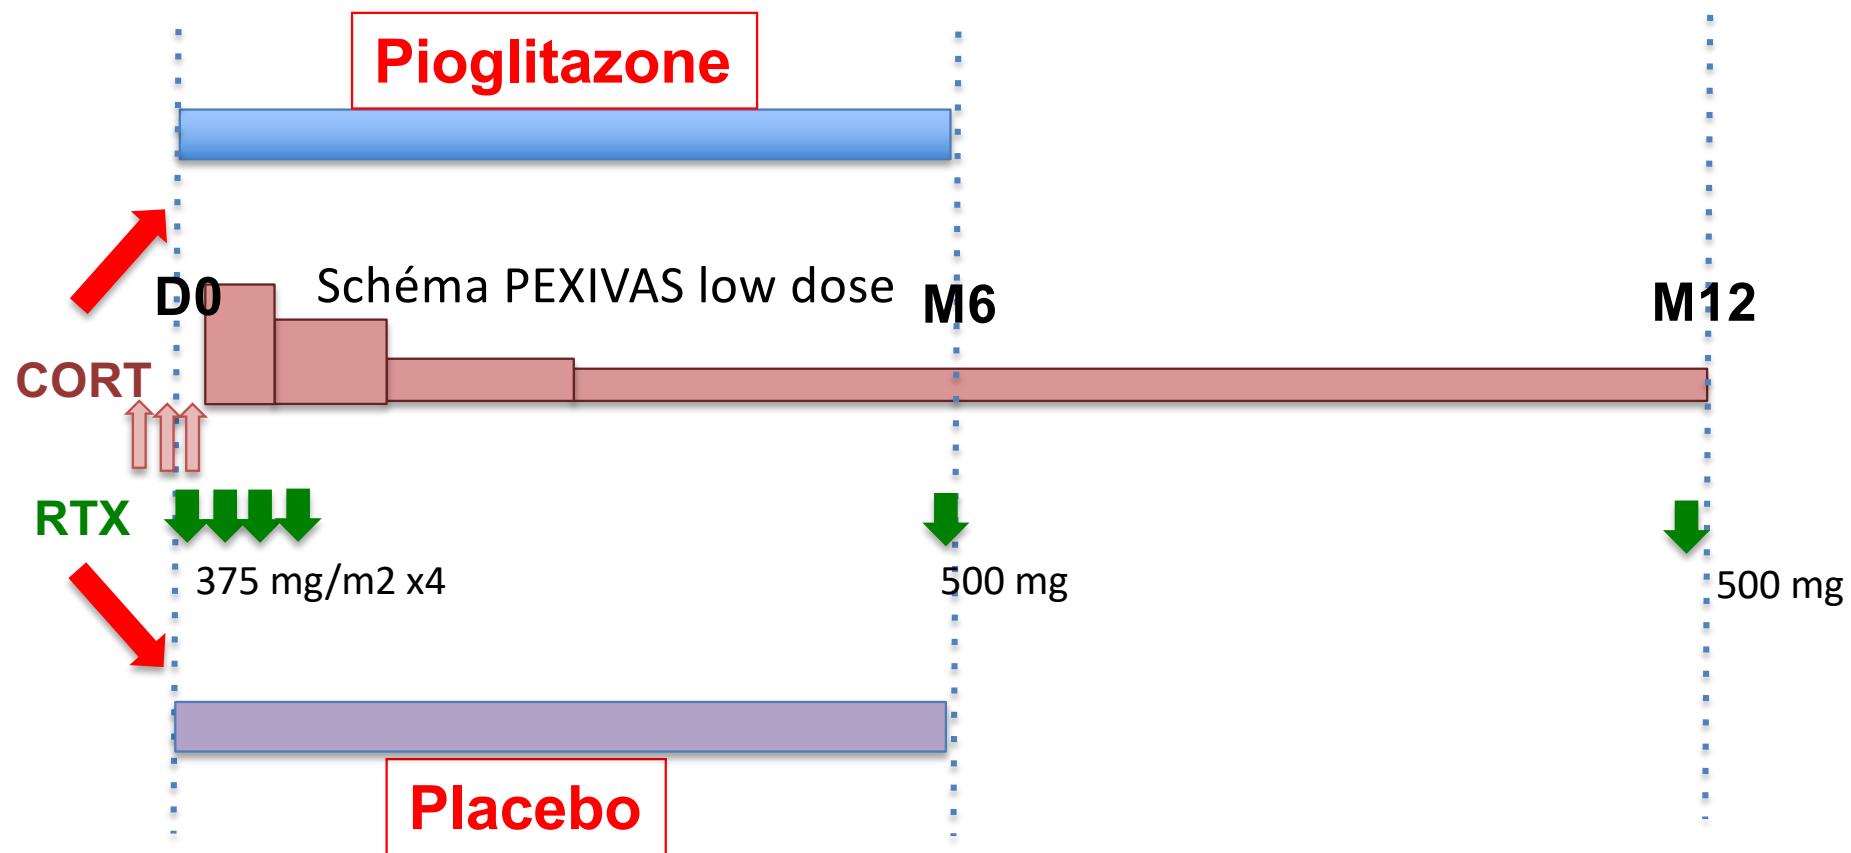

Essai RENATO

- Primary objective : to demonstrate a reduction of renal damage in ANCA-associated renal vasculitis, by pioglitazone add-on treatment on top of SOC standardized immunosuppressive regimen with glucocorticoids and rituximab.
- Secondary objectives :
 - To evaluate the efficacy of pioglitazone on long-term preservation of renal function,
 - To assess the efficacy of pioglitazone on the reduction of hypertension and metabolic side effects of glucocorticoids.
 - To describe the clinical and biological tolerance of pioglitazone in this population,
 - To measure the impact of this drug on renal and systemic vasculitis activity,

Essai RENATO

- Primary composite endpoint :
 - Improvement of serum creatinine (Delta sCreat) >30% of baseline value **AND** urine protein-to-creatinine (uPCR) <1g/g at week 26.
- Secondary endpoints :
 - sCreat, Delta sCreat, eGFR, renal survival (off-dialysis) and proteinuria (UPCR) at W4, W12, W26, W52
 - BVAS and ANCA positivity at W4, W12, W26, W52, Relapse rate
 - Renal vasculitis activity (urinary MCP-1, KIM-1, Calprotectin, CD163) at W4, W12, W26, W52.
 - Damage score (VDI) at W26, W52 and Glucocorticoid Toxicity Index (GTI) at W12, 26, 52
 - Blood pressure (ABPM and n of antihypertensive drugs), Diabetes (HbA1c), Lipid profile
 - Safety profile of pioglitazone

RENATO trial

Essai RENATO

- Inclusion criteria :

- Newly-diagnosed or relapsing AAV (GPA /MPA), with an active disease defined as a BVAS ≥ 3
- Presence of proteinuria (UPCR $>300 \text{ mg/g}$), haematuria ($>10 \text{ RBC/hpf}$) and eGFR $\geq 15 \text{ mL/min/1.73 m}^2$ at inclusion
- Recent (<4 weeks) renal biopsy that confirms renal involvement of ANCA-associated vasculitis
- Patients aged of 18 to 80 years

Essai RENATO

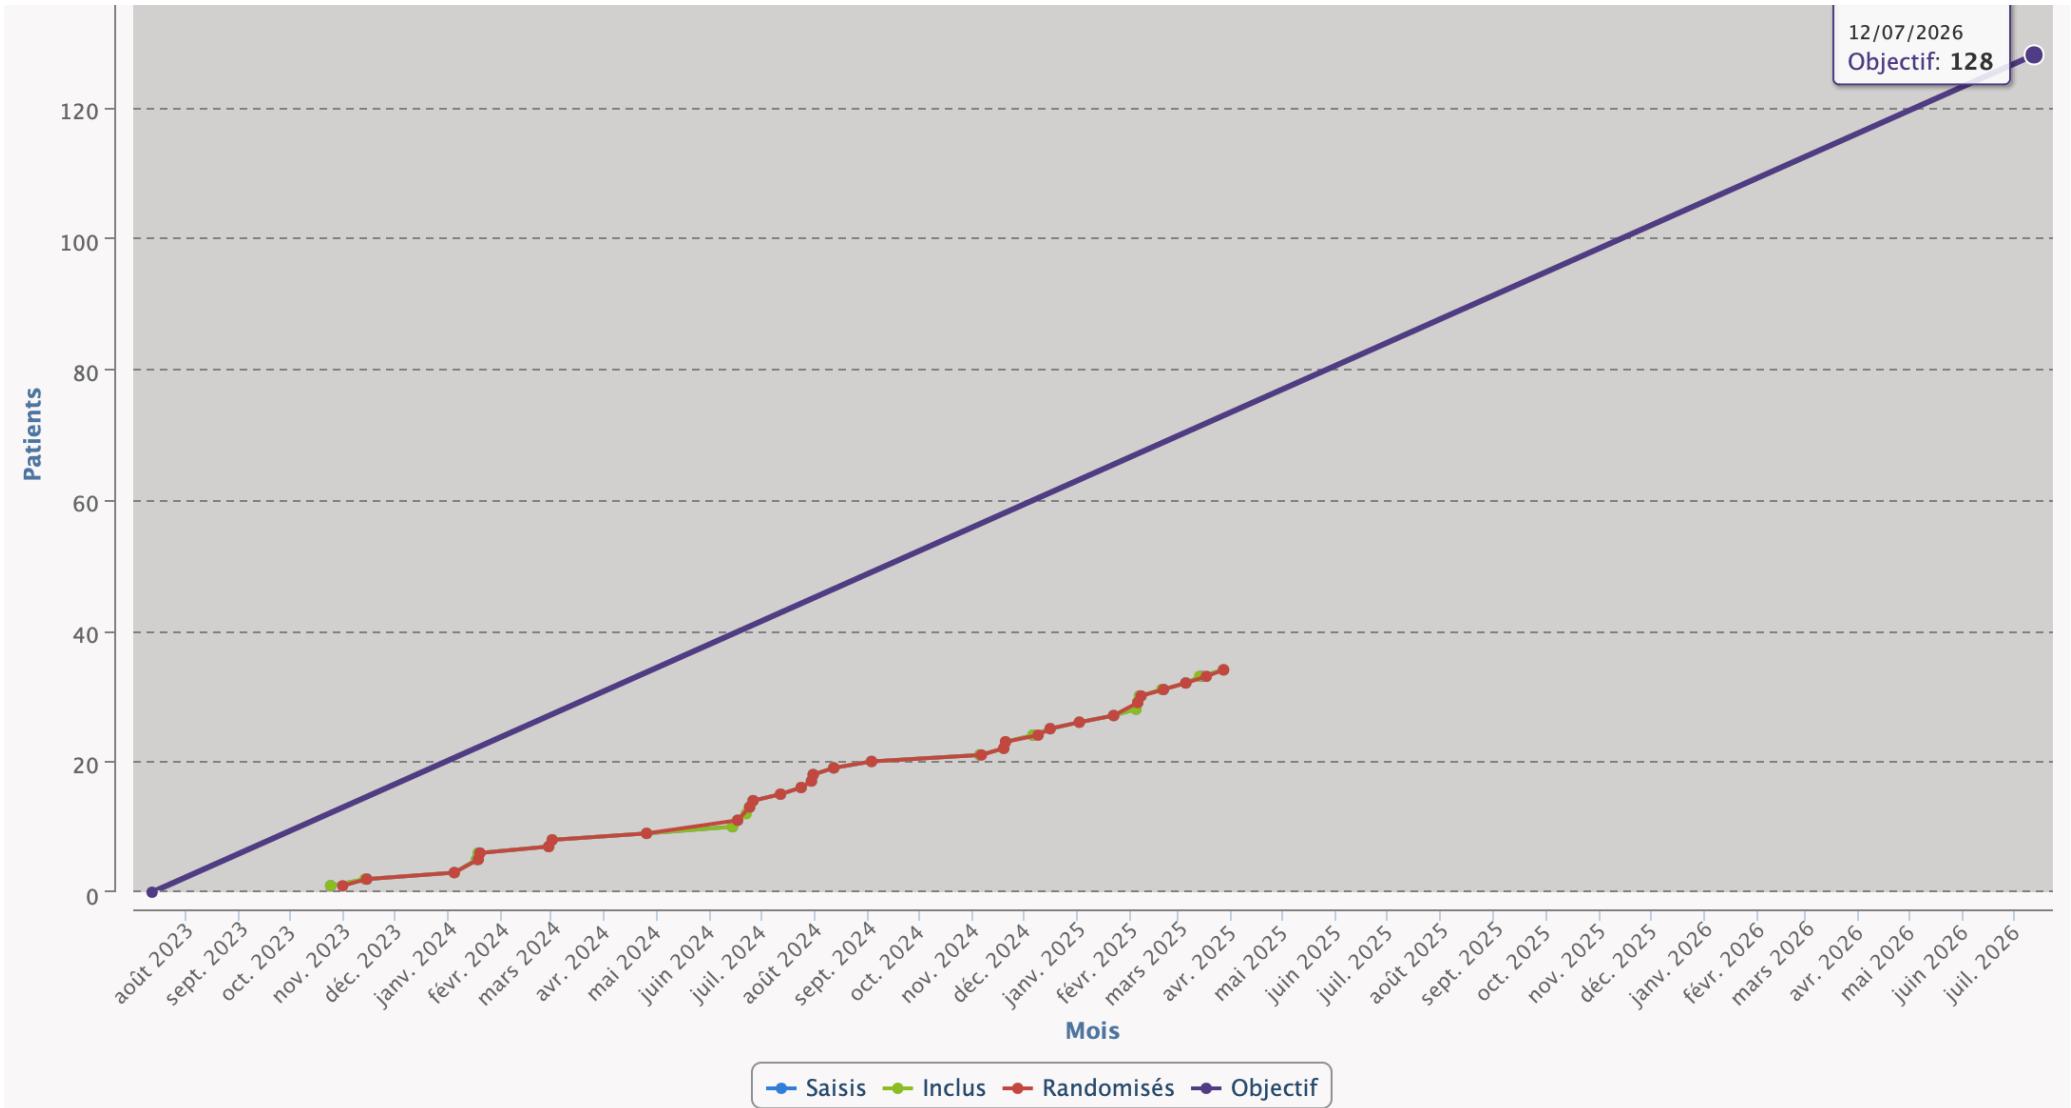

- Non-inclusion criteria :
- Severe kidney injury with eGFR <15 ml/min/1.73m² or dialysis therapy at inclusion
- Alveolar haemorrhage requiring pulmonary ventilation support at inclusion
- Active cancer (except non-melanoma skin cancer) within the past 24 months
- Past history of bladder or urinary tract cancer
- History of Class 3/4 congestive heart failure symptoms, Class 2 heart failure symptoms within the past 3 months and ejection fraction <40% on recent echocardiography
- Chronic liver disease
- Positive serology for HIV, HBV (Ag HBs positivity), HCV at inclusion
- Pregnant or breast-feeding women, or desire to become pregnant within 12 months
- Severe neurologic or psychiatric disease (e.g., dementia or schizophrenia)
- Kidney transplant recipients
- Cyclophosphamide or rituximab use within 26 weeks prior to screening

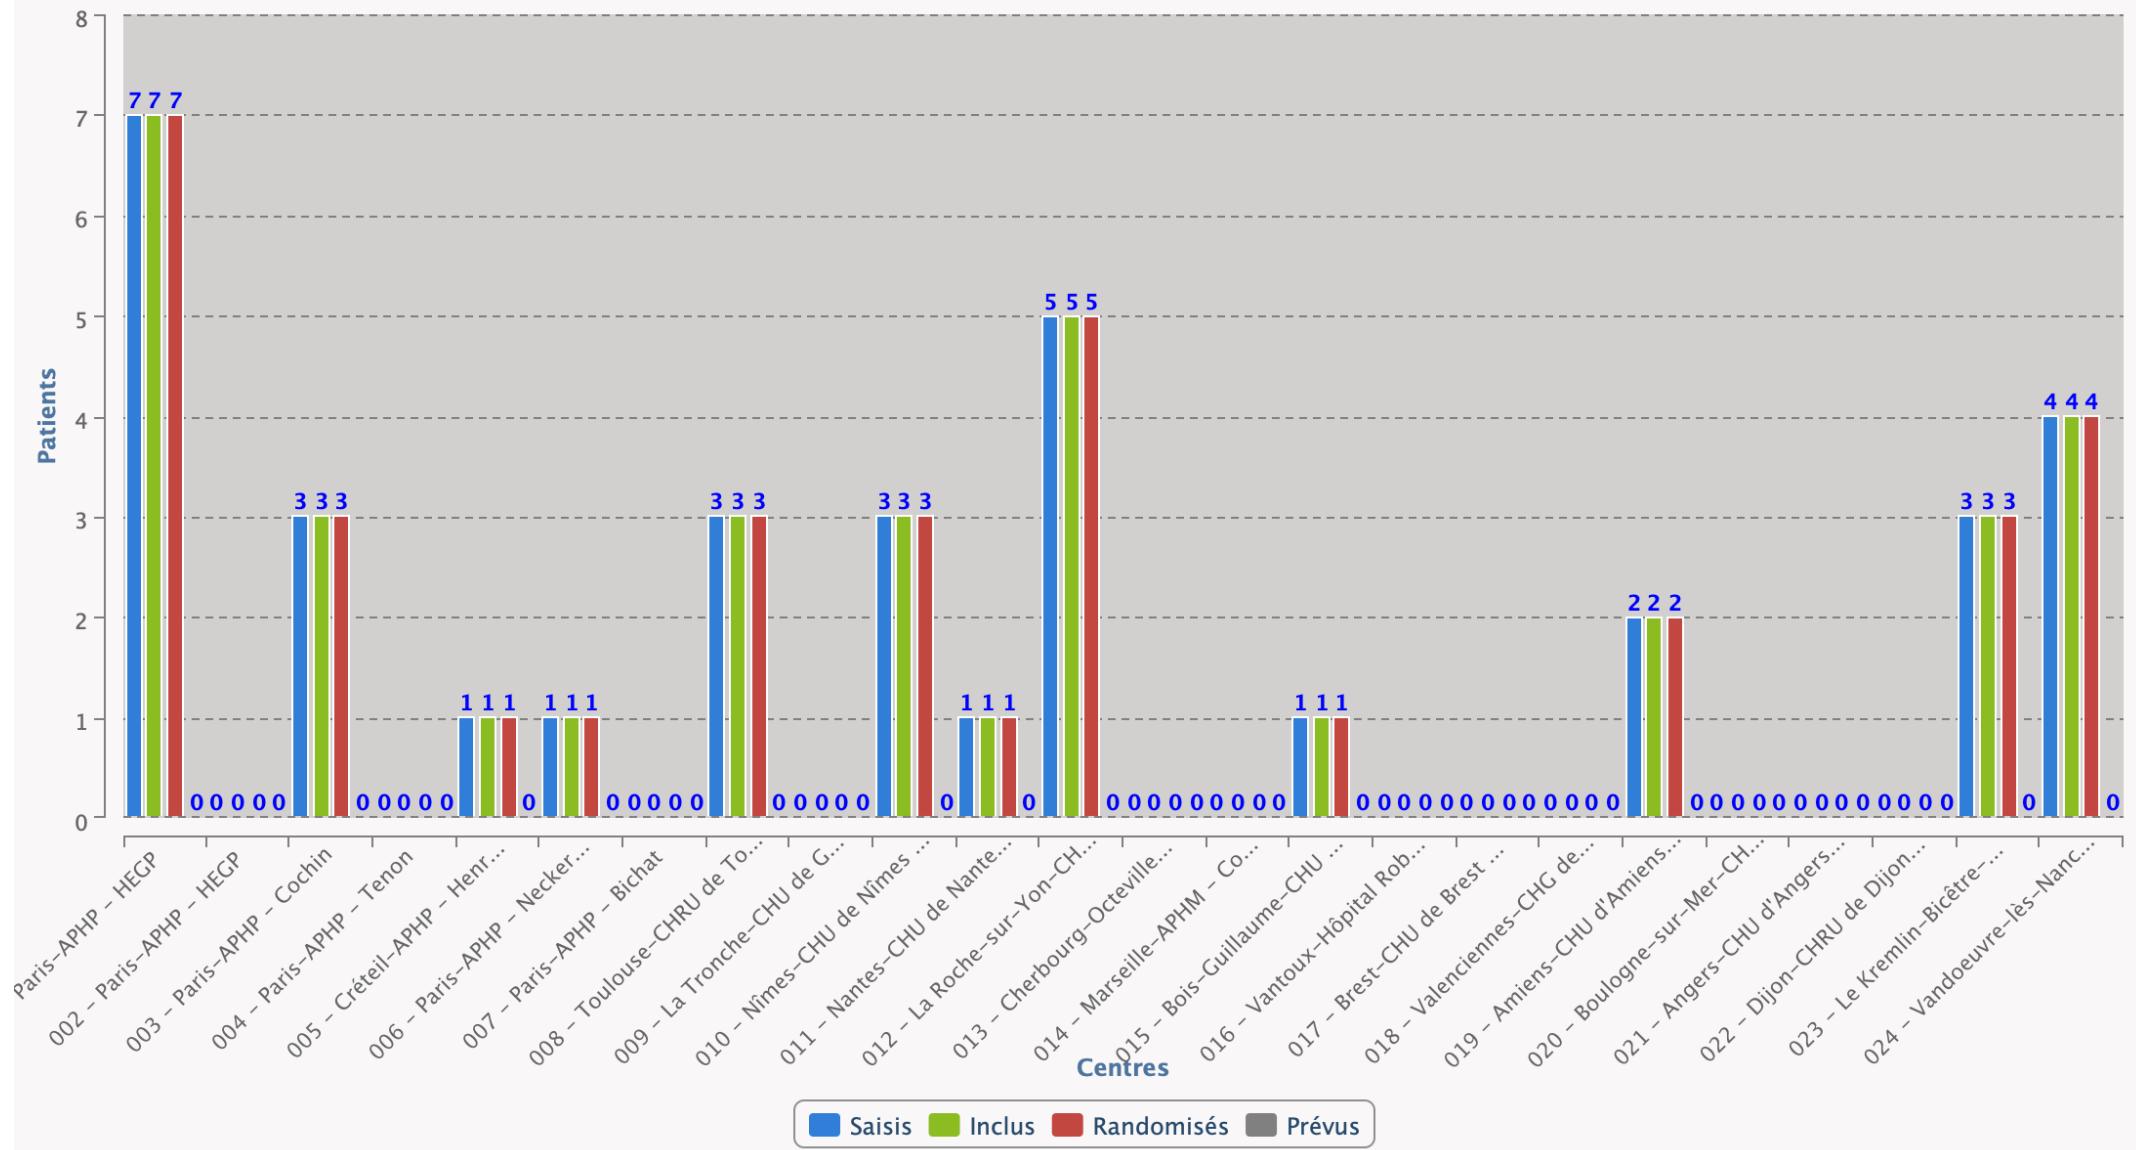

EIG spécifiques

- **Carcinomes urothéliaux**
 - Pas de sur-risque confirmé sur multiples essais et métanalyses récentes
 - Par précaution : pas de cyclophosphamide, non inclusion si ATCD
- **Insuffisance cardiaque :**
 - Sur-risque d'OMI et décompensation cardiaque dans qq études chez diabétique
 - Par précaution : non inclusion si ATCD d'insuffisance cardiaque classe III/IV
 - Echo cardiaque à l'inclusion et exclusion si FEVG <40%
 - Surveillance poids et BNP à chaque visite pdt 6 mois et diurétique si besoin
- **Hépatite, hypoglycémie, ostéoporose fracturaire, œdème maculaire**

Traitements associés

- Traitements antihypertenseurs (ICa, diurétiques, bétabloquants, alphabloquants) en visant TA <140/90 (135/85 sur MAPA W4 et W12)
- Débuter diurétiques en priorité si prise de poids, OMI ou élévation BNP
 - suspension pioglit/placebo si >3 kg/1 sem, doublement de BNP)
 - arrêt du traitement de l'étude si poussée d'IC congestive
- **Pas d'IEC, ARA2 ou iSGLT2 pdt les 6 premiers mois (sauf si HTA >160/95)**
- Utilisation libre des autres antidiabétiques
- Prophylaxies usuelles pneumocystose, ostéoporose cortisonique

Essai RENATO

- 128 patients à inclure
- Durée de la période d'inclusion : 3 ans
- Durée du suivi : 1 an
- Première inclusion : fin 2023 (34 patients inclus à ce jour)

MERCI pour votre aide
