

Power prices to rise slightly in The Northern Territory

Australian Energy Commission 2018 residential electricity price trends report

After an increase of 1% this year electricity prices are expected to increase by 2.7% over the next two years in line with the annual increase projected by the Northern Territory Government.

Power prices are estimated to rise slightly over the next two years in the Northern Territory according to the Australian Energy Market Commission's annual report on price trends released today.

Over the next two years the price paid for electricity by Northern Territory households is estimated to increase by a total \$47 (or 2.7%) from FY19 to FY21 in line with the price path set by the Northern Territory Government.

Over the next two years (from 2018-2019 to 2020-2021), the price trend is primarily driven by environmental costs and an average annual increase of 1.3% in wholesale costs with no change in network costs.

The Northern Territory's representative consumer (the most common type of household based on electricity consumption) is expected to be paying around \$47 more in July 2020 than they are today.

These estimated changes are based on the most common electricity customer in the Northern Territory which is a two-person household, consuming 6,613 kWh of electricity each year. Actual electricity bills depend on how and when electricity is used in each home.

AEMC Chief Executive, Mrs Anne Pearson, said the energy sector's challenge in years ahead will be to continue balancing electricity supply and demand as the energy market restructures.

"Cost control helps contain prices," she said.

"The changing generation mix is affecting supply and demand at the wholesale end of the supply chain.

"Our report also shows networks account for around half of consumer bills. Managing the costs of connecting new generation will be a major challenge. We must avoid over-engineered solutions to stop gold plating and price spikes," she said.

Mrs Pearson said it was in the strong interest of consumers that government and regulatory policy focused on long-term planning, focusing on low cost solutions to the issue of energy transition.

She said there was a need to:

- establish more certainty in wholesale markets through more effective management of environmental and security costs
- facilitate greater price competition in the retail market through open and transparent price setting that consumers can trust; and
- develop an integrated, modernised power grid that reduces costs to consumers.

Price trends will affect households differently depending on how much each consumer uses electricity. No two households use energy in the same way. Knowing how much power you use and when is important in controlling electricity bills in the future as new technologies become more affordable.

Continued

Mrs Pearson said the report recognised there were a range of issues unique to each jurisdiction that were also influencing price outcomes.

Price trends will affect individual households differently depending on how much each consumer uses electricity, and how willing they are to switch to a better energy deal where market offers are available. No two households use energy in the same way. Knowing how much power you use and when is important in controlling electricity bills in the future as new technologies become more affordable and energy entrepreneurs expand demand response options for consumers.

ABOUT THIS REPORT

The price trends report is a core document used to inform a range of stakeholders including the Australian Energy Market Operator the International Energy Agency and the Reserve Bank of Australia. It helps consumers understand costs included in their electricity bill. It also provides governments with information they need to understand changes in electricity prices and provides context for long-term decision making on energy policy. Price trends identified in this report are not a forecast of actual prices, but rather are a guide to pricing and bill directions based on current expectations, policy and legislation. Actual price movements will be influenced by how retailers compete, the dynamics of wholesale spot and contract markets, the outcomes of network regulatory decisions, and changes in policy and regulation.

The AEMC residential price trends focuses on the drivers of household bills across the three key parts of the electricity supply chain – wholesale (generation); regulated networks (transmission and distribution); and environmental (government policy schemes). In addition to these three main cost components the NT cost stack includes a cost differential which is the difference between prices set by the government and cost of supply.
